Eustyle: the space between 6 columns

Lower diameter held at 1 m. Metres are a modern scale choice, not a conversion from Roman feet.

Deliberately altered example: every gap is 2.25 D. The source instead prescribes a wider 3 D central opening. This is not the source's eustyle arrangement.

Lower diameter: 1 m. Ordinary gap: 2.25 D. Central gap: 2.25 D. Column height: 9.5 m (9.5 D). Front between outer shaft faces: 17.25 m (17.25 D).

A clear gap excludes the shafts; an axis-to-axis bay includes one diameter as well. The drawing scale is shared by the five systems for these settings. Profiles are schematic. Bases, capitals, entasis, corner thickening and structural loads are not modeled.

Compare the five systems

System	Gap / D	Centre / D	Height / D	Diameter / m	Front / m	Height / m
Pycnostyle	1.5	1.5	10	1	13.5	10
Systyle	2	2	9.5	1	16	9.5
Eustyle (altered centre)	2.25	2.25	9.5	1	17.25	9.5
Diastyle	3	3	8.5	1	21	8.5
Araeostyle (chosen gap)	4	4	8	1	26	8

Read the instructions

Vitruvius III.3.6 · printed p. 65

namque facienda sunt in intervallis spatia duarum columnarum et quartae partis columnae crassitudinis, mediumque intercolumnium unum, quod erit in fronte, alterum, quod in postico, trium columnarum crassitudine

Make the ordinary spaces two column-thicknesses and a quarter; make the middle gap at the front, and the corresponding one at the rear, three column-thicknesses.

The central opening is an exception. Medium intercolumnium is the middle gap, not a middle column. This model follows the stated ordinary diameter before the later corner-thickening adjustment in III.3.11.

Vitruvius III.3.7 · printed p. 65

frons loci quae in aede constituta fuerit, si tetrastylos facienda fuerit, dividatur in partes XI S praeter crepidines et proiecturas spirarum; si sex erit columnarum, in partes XVIII; si octastylos constituetur, dividatur in XXIV et semissem

Divide the intended front into eleven and a half parts for four columns, excluding the steps and projecting bases; into eighteen for six columns; into twenty-four and a half for eight columns.

S abbreviates a half, semis. Each part becomes one lower column diameter. These totals include the columns themselves as well as the clear gaps. The numbers follow Krohn's printed text; his apparatus below records variant readings.

Vitruvius III.3.10 · printed p. 66

eustyli autem aedis columnae, uti systyli, in novem partes altitudo dividatur et dimidiam partem, et eius una pars constituatur in crassitudine imi scapi

For an eustyle temple, as for a systyle one, divide the column's height into nine and a half parts; make one part the thickness at the bottom of the shaft.

Altitudo is height; crassitudo is thickness or diameter here. Novem ... et dimidiam partem says nine and a half. The drawing uses this passage and the other four proportions in III.3.10, rather than silently substituting a different translation's number.

Greek word-parts

στῦλος (stylos): pillar, column. The recurring -style part belongs to the Greek word for a pillar. It is unrelated to a stylistic preference in the modern sense. Dictionary.

πυκνός (pyknos): close, compact. Pycno- describes close spacing. The same Greek word gives Pyknon, our separate experiment in close musical intervals. Dictionary.

σύν (syn): with, together. The first part of systyle is a form of this combining element. The architectural ratio comes from Vitruvius's definition, not from the word-part alone. Dictionary.

διά (dia): through; apart in compounds. Dia- can express separation in a compound. Here Vitruvius gives the numerical gap as three diameters. Dictionary.

ἀραιός (araios): sparse, not close-set. Araeo- describes wide separation. It does not itself specify four diameters or any other fixed number. Dictionary.

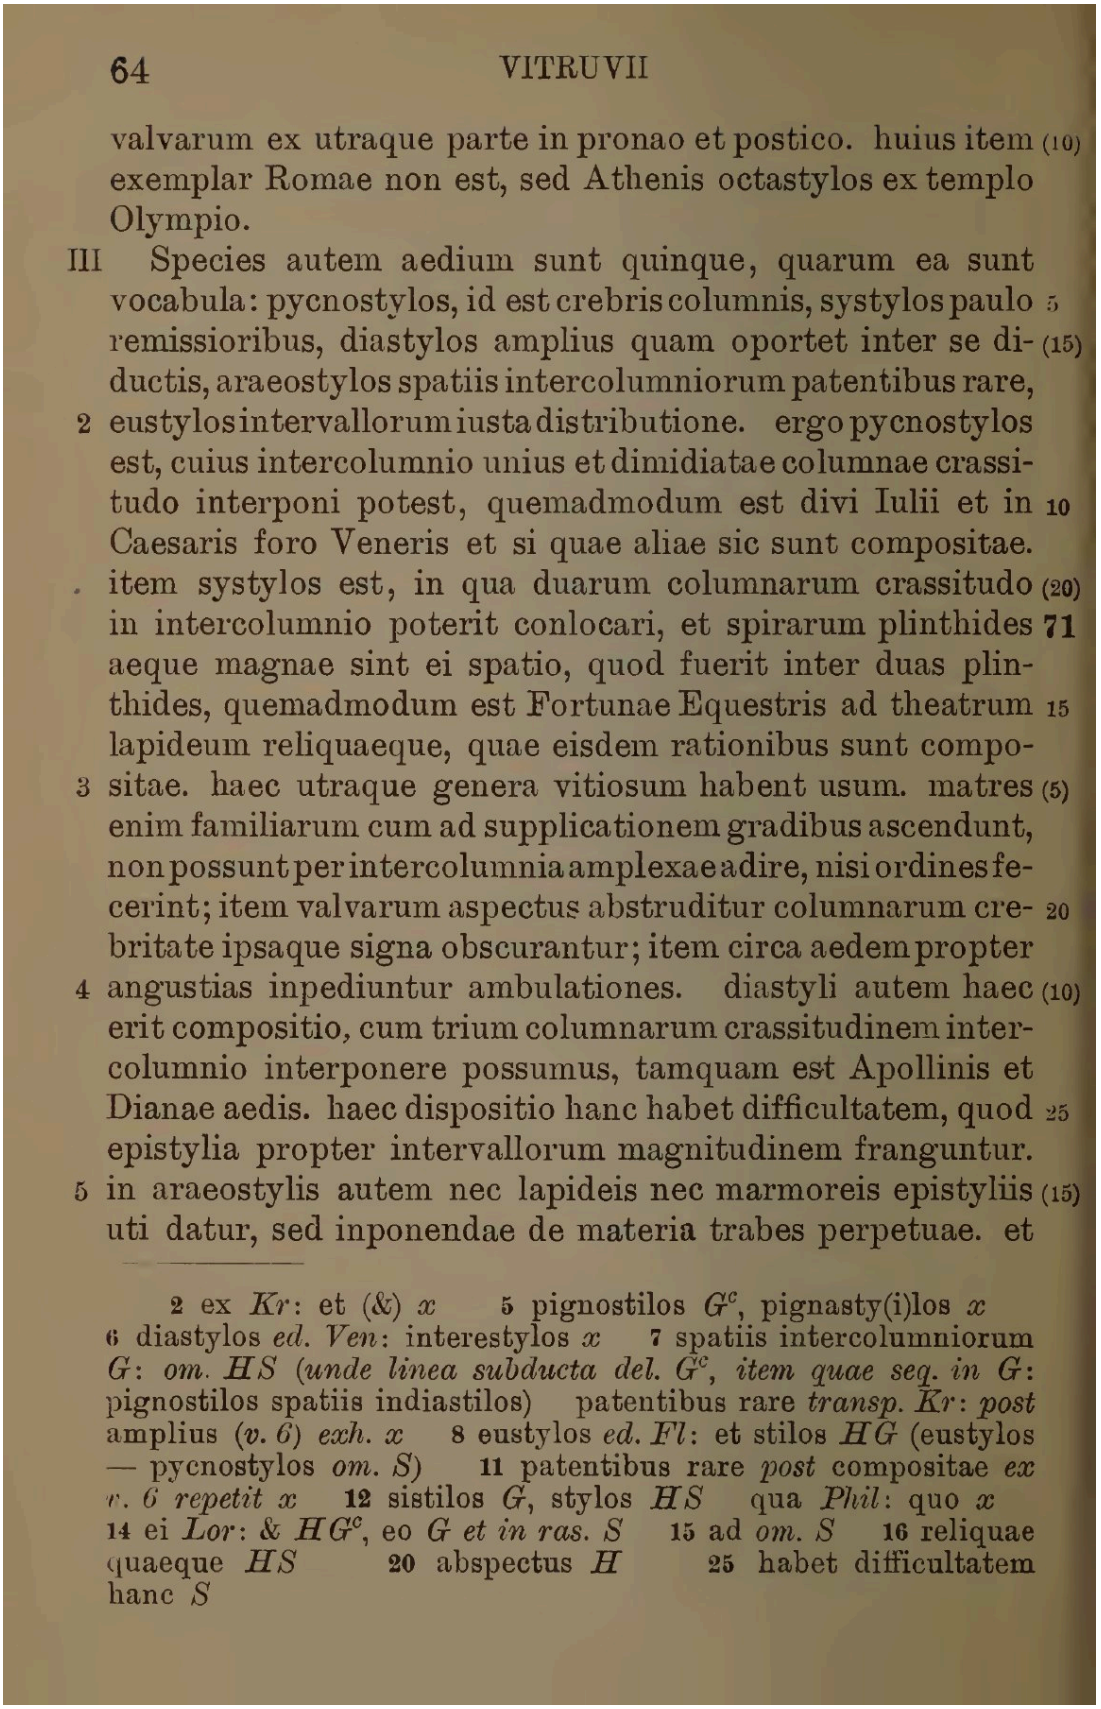

εὖ (eu): well. Eu- conveys a favorable judgment. Vitruvius prefers the eustyle arrangement; the name does not establish that every surviving temple followed it. Dictionary.

Vitruvius writes in Latin. These Greek headwords explain borrowed names; they are not a fabricated Greek version of his passage. English translations and teaching notes are new.

The printed evidence

F. Krohn, *Vitruvii De architectura libri decem* (Teubner, 1912), pp. 64–67. Public-domain page images from the Internet Archive scan. Line-end hyphens have been joined in the excerpts; numerals and the editor’s readings are retained.

valvarum ex utraque parte in pronao et postico. huius item exemplar Romae non est, sed Athenis octastylos ex templo Olympio.

III Species autem aedium sunt quinque, quarum ea sunt vocabula: pycnostylos, id est crebris columnis, systylos paulo remissioribus, diastylos amplius quam oportet inter se ductis, araeostylos spatiis intercolumniorum patentibus rare,
2 eustylos intervallorum iusta distributione. ergo pycnostylos est, cuius intercolumnio unius et dimidiatae columnae crassitudo interponi potest, quemadmodum est divi Iulii et in Caesaris foro Veneris et si quae aliae sic sunt compositae. item systylos est, in qua duarum columnarum crassitudo in intercolumnio poterit conlocari, et spirarum plinthides aeque magnae sint ei spatio, quod fuerit inter duas plinthides, quemadmodum est Fortunae Equestris ad theatrum lapideum reliquaeque, quae eisdem rationibus sunt compo-
3 sitae. haec utraque genera vitiosum habent usum. matres enim familiarum cum ad supplicationem gradibus ascendunt, non possunt per intercolumnia amplexae adire, nisi ordines fecerint; item valvarum aspectus abstruditur columnarum crebritate ipsaque signa obscurantur; item circa aedem propter
4 angustias inpediuntur ambulationes. diastyli autem haec erit compositio, cum trium columnarum crassitudinem intercolumnio interponere possumus, tamquam est Apollinis et Dianae aedis. haec dispositio hanc habet difficultatem, quod epistylia propter intervallorum magnitudinem franguntur.
5 in araeostylis autem nec lapideis nec marmoreis epistyliis uti datur, sed inponendae de materia trabes perpetuae. et

ipsarum aedium species sunt varicae, barycephalae, humiles, latae, ornanturque signis fictilibus aut aereis inauratis earum fastigia tuscanico more, uti est ad Circum Maximum Cereris et Herculis Pompeiani, item Capitolii.

Reddenda nunc est eustyli ratio, quae maxime probabilis 6 et ad usum et ad speciem et ad firmitatem rationes habet explicatas. namque facienda sunt in intervallis spatia duarum columnarum et quartae partis columnae crassitudinis, mediumque intercolumnium unum, quod erit in fronte, alterum, quod in postico, trium columnarum crassitudine. sic enim habebit et figurationis aspectum venustum et aditus usum sine inpeditionibus et circa cellam ambulatio auctoritatem. huius autem rei ratio explicabitur sic. frons loci quae in 7 aede constituta fuerit, si tetrastylos facienda fuerit, dividatur in partes XI s praeter crepidines et proiecturas spirarum; si sex erit columnarum, in partes XVIII; si octastylos constituetur, dividatur in XXIV et semissem. item ex his partibus sive tetrastyli sive hexastyli sive octastyli una pars sumatur, eaque erit modulus. cuius moduli unus erit crassitudinis columnarum. intercolumnia singula, praeter media, modulorum duorum et moduli quartae partis; mediana in fronte et postico singula ternûm modulorum. ipsarum columnarum altitudo modulorum VIIII et dimidiae moduli partis. ita ex ea divisione intercolumnia altitudinesque columnarum habebunt iustam rationem. huius exemplar 8 Romae nullum habemus, sed in Asia Teo hexastylon Liberi Patris.

Eas autem symmetrias constituit Hermogenes, qui etiam primus invenit octastylon pseudodipterive rationem. ex dipteri enim aedis symmetria distulit interiores ordines columnarum XXXIV eaque ratione sumptus operasque compendii fecit. is in medio ambulationi laxamentum egregie circa cellam fecit de aspectuque nihil inminuit, sed sine desiderio supervacuorum conservavit auctoritatem totius operis distributione. pteromatos enim ratio et columnarum circum aedem dispositio ideo est inventa, ut aspectus propter asperitatem intercolumniorum habeat auctoritatem, praeterea, si ex ⟨improviso⟩ imbrium aquae vis occupaverit et intercluserit hominum multitudinem, ut habeat in aede circaque cellam cum laxamento liberam moram. haec autem ut explicantur in pseudodipteris aedium dispositionibus! quare videtur acuta magnaque sollertia effectus operum Hermogenes fecisse reliquisseque fontes, unde posteri possent haurire disciplinarum rationes.

Aedibus araeostylis columnae sic sunt faciendae, uti crassitudines earum sint partis octavae ad altitudines. item in diastylo dimetienda est altitudo columnae in partes octo et dimidiam, et unius partis columnae crassitudo conlocetur. in systylo altitudo dividatur in novem et dimidiam partem, et ex eis una ad crassitudinem columnae detur. item in pycnostylo dividenda est altitudo in ⟨partes⟩ decem, et eius una pars facienda est columnae crassitudo. eustyli autem aedis columnae, uti systyli, in novem partes altitudo dividatur et dimidiam partem, et eius una pars constituatur in crassitudine imi scapi. ita habebitur pro rata parte intercolumniorum ratio. quemadmodum enim crescunt spatia inter

columnas, proportionibus adaugendae sunt crassitudines scaporum. namque si in araeostylo nona aut decima pars crassitudinis fuerit, tenuis et exilis apparebit, ideo quod per latitudinem intercolumniorum aer consumit et inminuit aspectu scaporum crassitudinem. contra vero pycnostylis si octava pars crassitudinis fuerit, propter crebritatem et angustias intercolumniorum tumidam et invenustam efficiet speciem. itaque generis operis oportet persequi symmetrias. etiamque angulares columnae crassiores faciendae sunt ex sua diametro quinquagesima parte, quod eae ab aere circumciduntur et graciliores videntur esse aspicientibus. ergo quod oculus fallit, ratiocinatione est exaequandum. contracturae autem in summis columnarum hypotracheliis ita faciendae videntur, uti, si columna sit ab minimo ad pedes quinos denos, ima crassitudo dividatur in partes sex et earum partium quinque summa constituatur. item quae erit ab quindecim pedibus ad pedes viginti, scapus imus in partes sex et semissem dividatur, earumque partium quinque et semisse superior crassitudo columnae fiat. item quae erunt a pedibus viginti ad pedes triginta, scapus imus dividatur in partes septem, earumque sex summa contractura perficiatur. quae autem ab triginta pedibus ad quadraginta alta erit, ima dividatur in partes septem et dimidiam; ex his sex et dimidiam in summo habeat contracturae rationem. quae erunt ab quadraginta pedibus ad quinquaginta, item dividendae sunt in octo partes, et earum septem in summo scapo sub capitulo contrahantur. item si quae altiores erunt, eadem ratione pro rata constituantur contracturae. haec
